

Student Support Insights Tool - Final Assignment Evaluation and Fix List

Prepared for Yonela Jongola

This review is separate from the final submission report. It is intended to help clean the project before hand-in or live hosting. Do not submit this review unless specifically requested.

Overall Readiness Verdict

The assignment is strong in concept, functionality, ethics, visual evidence and report structure. It meets the major assessment requirements: working prototype, integrated report, synthetic dataset, visualisations, insights, recommendations, process models, value model, ethics review, testing log and SFIA evidence mapping.

Area	Status	Comment
Prototype	Strong	Core dashboard, upload, validation, risk scoring and recommendations are present.
Report	Strong	The integrated report now has a polished structure and evidence traceability.
Ethics	Strong	Human review, privacy and non-automation limits are well covered.
Evidence	Good	Screenshots, test log, bug log and SFIA mapping are present.
Packaging	Needs cleanup	The current ZIP includes dependency/build folders that should not be submitted.
Clean build	Needs fix	Frontend clean install fails because lucide-react is imported but missing from package.json/package-lock.
Hosting readiness	Good for demo	Use synthetic data only unless authentication and endpoint protection are added.

Critical Fixes Before Final Submission

Issue	Why it matters	Exact fix
Unclean ZIP package	The ZIP includes frontend/node_modules, frontend/dist, backend/bin, backend/obj and artifacts build folders. This looks unprofessional and makes the package too large.	Delete those folders before zipping. Use .gitignore and zip exclusions.
lucide-react missing from package.json	Clean npm install/typecheck fails because ActionCluster.tsx and HelpModal.tsx import lucide-react	Run npm install lucide-react and commit package.json + package-lock.json, or remove lucide icons.

	but it is not listed as a dependency.	
HighRiskCount double-counts Critical	DashboardSummaryDto HighRiskCount currently counts High or Critical while CriticalRiskCount is separate. This can make KPI totals confusing.	Change HighRiskCount to count CategoryHigh only. Add InterventionRiskCount for High + Critical.
Report references missing screenshot file	final_submission.md references dashboard-overview-report-clean.png, which is not present in screenshots.	Use dashboard-overview.png or add the missing screenshot file.
Peer review still has placeholder reviewer details	The completed review record still says [Insert real reviewer name before hand-in].	Replace with the real reviewer name and role, or remove the completed review from submission until signed.
.NET 10 target may be risky	Some assessors or hosting services may not have .NET 10 installed.	Use net8.0 LTS if compatible, or provide clear .NET 10 SDK evidence and installation note.
Seed dataset may not publish with backend	LearnerDataService does not include AppContext.BaseDirectory/data/Dataset as a seed candidate and csproj does not copy the CSV to publish output.	Add Content Include in .csproj and read from AppContext.BaseDirectory/data/Dataset/synthetic_learners.csv.
Public read endpoints for real hosting	GET learners/dashboard/risk endpoints expose learner support data if real data is used.	Protect data/risk endpoints with authentication/API key before real data use.
Health docs mention live endpoint but code only has health and ready	Some hosting evidence may expect /api/health/live.	Add /api/health/live or update documentation to match implemented endpoints.

Recommended Final Commands

After applying the fixes, run these commands and capture screenshots:

Frontend: `cd frontend && npm ci && npm run typecheck && npm run build`

Backend: `cd backend && dotnet restore && dotnet build --configuration Release && dotnet run`

Clean Zip Command

```
zip -r student-support-insights-tool-final.zip student-support-insights-tool-clean -x "**/node_modules/**"
"**/dist/**" "**/bin/**" "**/obj/**" "**/artifacts/**" "**.db" "~$"
```

Final Submission Advice

Submit the polished final report, README, data folder, docs folder, backend/frontend source code, evidence folder and screenshots. Do not submit dependency folders or temporary build output. Keep the assignment positioning clear: the tool is a synthetic-data decision-support prototype for human-reviewed learner support planning.
